

Anyone who's invested in Bitcoin can attest to that: it's currently doing so well, salty competitors are threatening to sue the company. A new version of the currency hit the market on August 1, 2017, and it's been making waves ever since. It's known as Bitcoin Cash – and it's the controversial breakaway from Bitcoin that's been breaking all records.

On the second day of trading alone, Bitcoin Cash tripled in value, with a market cap that sits it comfortably as the third largest of all digital currencies. With a valuation of \$12 billion seemingly overnight, it's evident that investors savvy enough to know how to walk the tightrope in cryptocurrency trading can profit immensely.

And it's not just Bitcoin Cash that's in the picture — its predecessor, Bitcoin, still owns the lion's share of the market, having been around since 2008. Then there's Eretheum, called the "silver" to Bitcoin's gold. All these currencies are flexible for developers, making it even more appealing.

Benefits of Investing in Cryptocurrency

Lower Inflation

Transactions are simple, easy & cheap

Portable

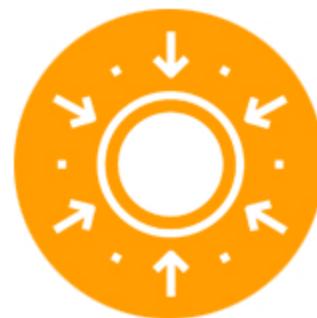

Cannot be Traced

No Identity Theft

Access to Everyone

Decentralised Network

Universal Acceptance
